

It was shown that concentration of TGFb in blood serum of healthy subjects is about 18.2 ng/mL. Molecular weight of TGFb = 25000 g/mol [PMID: 2119582].

$$18.2 \text{ ng/mL} = 18.2 * 1000000 / 25000 \text{ pmol/L} = 728 \text{ pmol/L}.$$
